

Running the Air Quality Project and Verifying Data in MongoDB

1. Navigate to the Project Directory

Open Command Prompt and navigate to the project folder:

```
cd "C:\Users\hp\OneDrive\Desktop\air quality project"
```

2. Install Required Dependencies

Install the required Node.js packages:

```
npm install express mongoose body-parser cors
```

These dependencies are used to build the backend server and connect the application with MongoDB.

3. Start the Node.js Server

Run the server using:

```
node server.js
```

If the MongoDB connection is successful, the terminal will display:

```
MongoDB Connected Successfully
```

4. Open the Contact Page

Open the project in Visual Studio Code. Locate **contact.html**, right-click it, and select **Open with Live Server**. The Contact page will open in the browser.

5. Submit the Contact Form

Enter the required details in the Contact Form and click the **Submit** button. After successful submission, the server may display:

```
New Contact Saved
```

This indicates that the submitted contact information has been stored successfully in MongoDB.

6. Verify the Data in MongoDB Compass

- 1 Open MongoDB Compass.
- 2 Select the connection **localhost:27017**.
- 3 Click **Connect**.
- 4 Locate the database named **airqualitydb**.
- 5 Open the database.
- 6 Select the **contact** collection.
- 7 Verify that the submitted contact form data is displayed.

Result

The Air Quality project backend was successfully executed using **Node.js, Express.js, and MongoDB**. The contact form data was submitted from the frontend, stored successfully in the MongoDB database, and verified using MongoDB Compass.
